

IBM Lotus Notes Traveler

for Nokia smartphones

Data sheet

NOKIA
Connecting People

Save the day and retrieve vital information from anywhere. New IBM® Lotus Notes® Traveler software means Nokia smartphones are always in sync.

The new capabilities in Lotus Notes Traveler 8.5.3 embrace and enhance mobile capabilities across Nokia S60 and Symbian OS smartphone models and help increase productivity for your mobile workers, allowing them to conveniently access business information from any location. In addition, system administrators will want to leverage new device management capabilities in 8.5.3, such as a new device approval policy and enforced device encryption giving them more options to manage their mobile user community and align with corporate security requirements. This includes synchronisation of IBM Lotus Notes email, calendars, contacts, journals and to-do data. The latest version of Lotus Notes Traveler client (8.5.3) now extends the features:

- Enforced device and memory card encryption
- Direct HTML email viewing
- Corporate directory search by groups, mail-in databases and individuals
- Homescreen short-cut for direct access to Traveler inbox
- Enhanced user experience on touch devices and support for Nokia devices based on new Symbian OS
- Device approval policy for administrators to easily manage their mobile user group

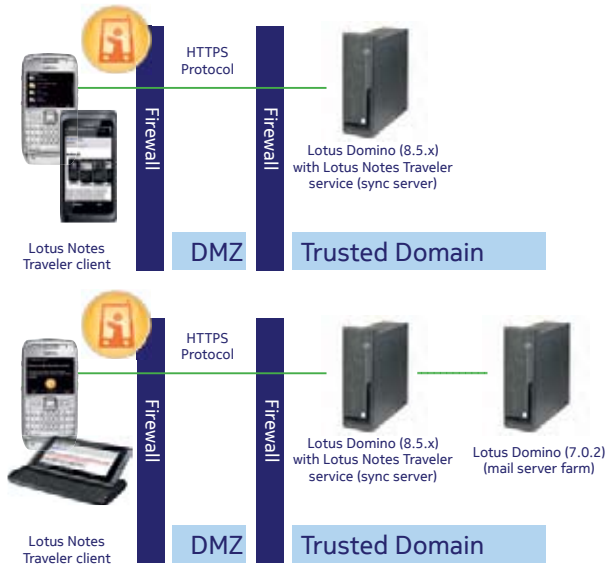

With Lotus Notes Traveler software, your company can benefit from cost efficient mobile push email and personal information management, without the need for additional third-party middleware.

Provided the end user has access to a Lotus Domino server, the Lotus Notes Traveler software enables them to wirelessly synchronise email, calendars, contacts, journals and to-do data. It also supports basic email features, such as create, reply, forward, delete, and attachment management. Plus, it provides

meeting request support. This includes accepting or rejecting meeting invitations (with comments), as well as opening attachments. Lotus Notes Traveler software also provides a secure socket layer (SSL) connection for securing the data sent over-the-air. When customers require higher security, mobile solutions such as IBM Lotus Mobile Connect, which provides a VPN client solution for Nokia S60 devices, can be added to the Traveler environment to provide secure and reliable connections to your companies business information for your mobile workers. Nokia smartphones complement the IBM security offering with features such as device lock. In addition, company policies can be put in place stipulating the use of device autolock, password complexity and device encryption. These features also prevent access to confidential data on handsets and memory cards, when end users are away from the office. Lotus Notes Traveler software is currently available for IBM Lotus Notes customers through IBM channels worldwide. It can also be downloaded from Nokia Ovi Store, at no additional charge, for customers who currently license and deploy a Lotus Domino 8.5.3 server (or later version). An existing Lotus Domino server environment (release 7.0.2 or higher) can be mobilised by using at least one Lotus Domino 8.5.3 server or greater.

IBM. **Lotus.** software

Lotus Notes Traveler features on Nokia smartphones

General Key Features for Lotus Notes Traveler 8.5.3:

- Supports Nokia Symbian S60 3rd/5th Edition, and Nokia Symbian OS devices
