# Energy and Mobility: Scalable Solutions for the Mobile Data Explosion

---

Antonio Capone

**SEW – GreenTouch**

June 20, 2012

# Energy consumption in wireless access networks

# Energy consumption in wireless access networks

□ Baseline energy consumption comparable (macro) or much larger (micro) than load dependent component

□ Technology improvements:

- Power amplifiers
- Advanced transmission technologies
- Multiple antenna systems
- Centralized base band processing
- Etc.

Source: EARTH project

# Energy consumption in wireless access networks

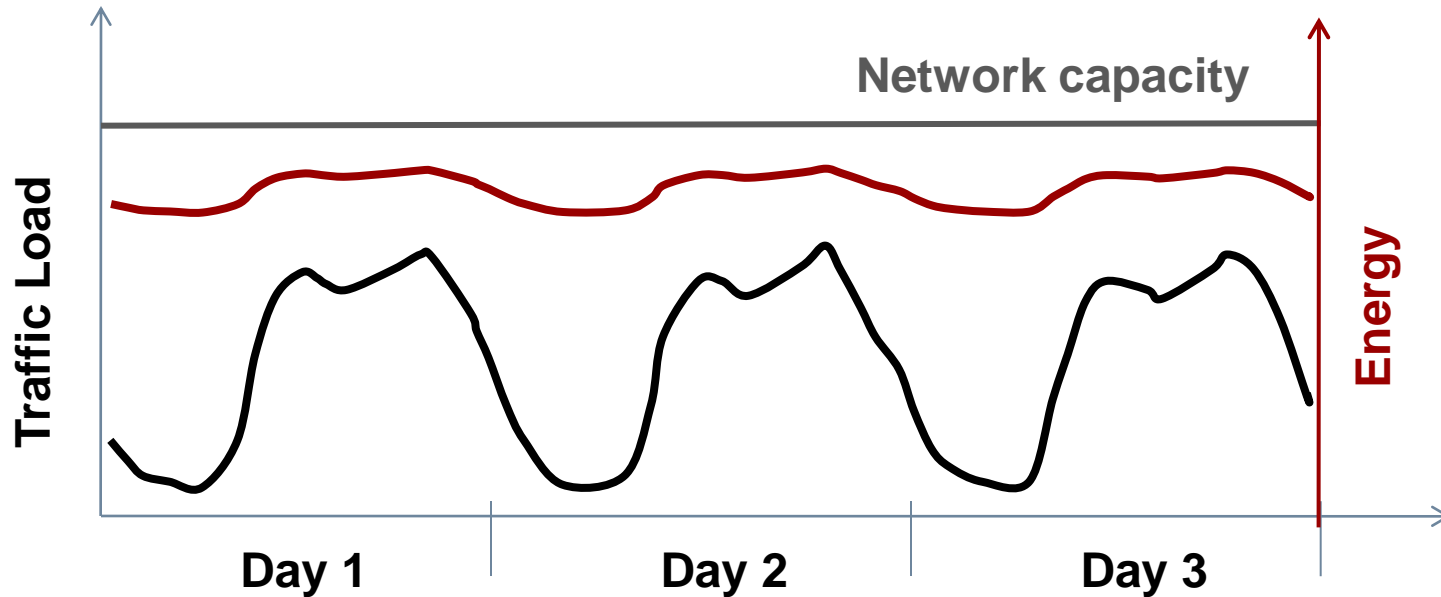

- Mobile traffic explosion
- Stimulated by smart phone diffusion
- Faster technology evolution
- From macro cells to small cells (micro, pico, femto)

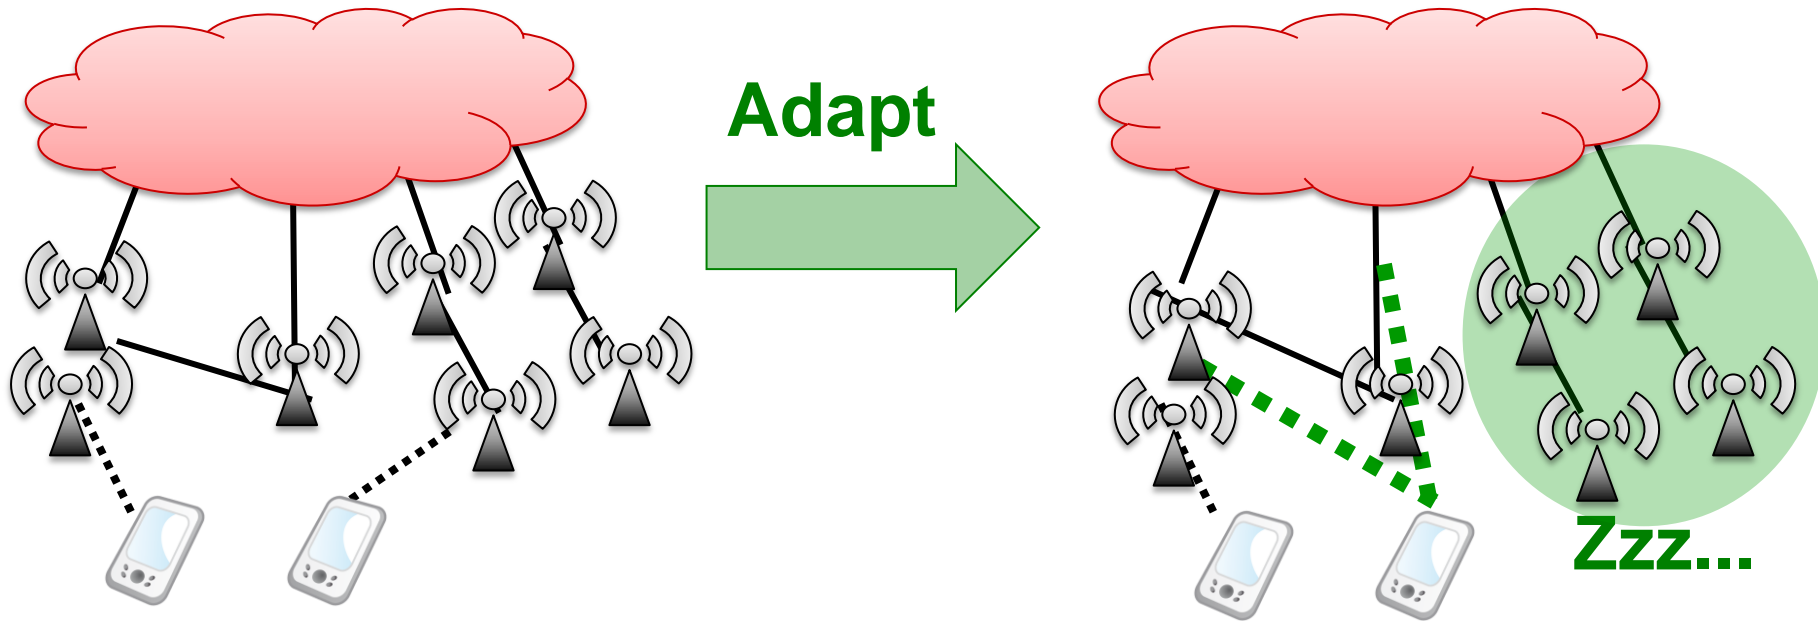

Source: CISCO VNI Mobile 2012

# Variable Traffic load

- ❑ Wireless access networks are dimensioned for estimated peak demand using dense layers of cell coverage
- ❑ Traffic varies during the day
- ❑ Energy consumption is almost constant

- Novel network structures and management policies that maximizes Energy Efficiency:
  - Efficient utilization of space;
  - Real-time network adaptation based on load requirements;
  - Support of sleep modes

# Limits of traditional cellular architectures

---

- ❑ Unfortunately, there are some limiting constraints of the traditional cellular architecture that prevent high energy savings
- ❑ Cellular networks require **full coverage** of the service area for supporting the **any-time everywhere service** paradigm
- ❑ Turning off some base stations is possible only if their areas are covered by some other base stations that are active
- ❑ **Large overlaps** among cells is required
- ❑ **Capacity over-provisioning** for flexibility allowance

# Energy adaptation with full coverage

# Limits of traditional cellular architectures

---

- ❑ It has been shown that with traditional cellular technologies **energy savings** in the range of **20%-40%** can be achieved
- ❑ Due to traffic increase and higher energy efficiency it is expected that in the **future micro and pico cellular layouts** will be preferred over traditional macro cellular ones
- ❑ This may even **reduce the savings** achievable with energy management since most of the base stations are essential for providing full coverage

# Micro-cellular coverages

# "Remember to turn off the light"

In cellular systems  
light is always on

Kids, dinner is ready!  
Remember to turn off  
the light

# Beyond cellular

---

- We need to go beyond the cellular paradigm that requires always-on full coverage
- And move towards an “**on demand**” **coverage** model
- While guaranteeing service availability everywhere and anytime

# Beyond Cellular Green Generation (BCG<sup>2</sup>)

# BCG<sup>2</sup>: Basic idea

## Traditional cellular

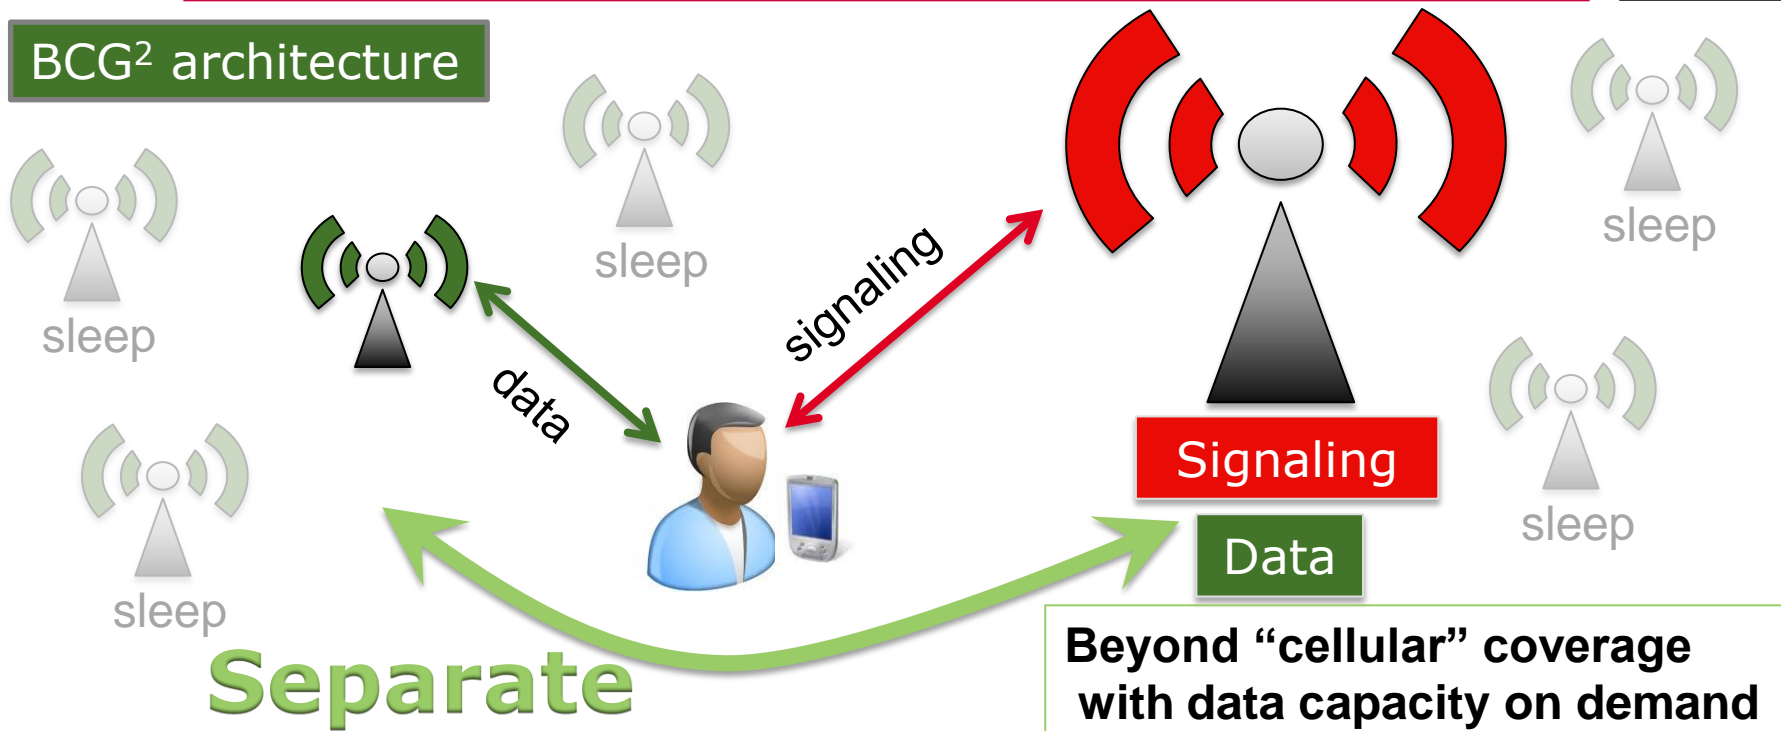

Limitation of traditional cellular architecture:

- Continuous and full coverage for data access
- Limited flexibility for energy management
- High energy consumption also at low traffic load

# BCG<sup>2</sup>: Basic idea

## BCG<sup>2</sup> architecture

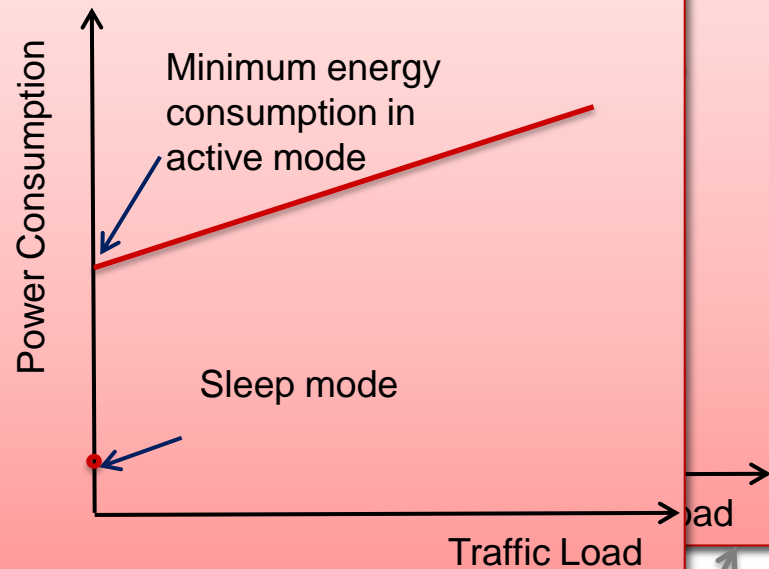

Separation of signaling and data functions at the radio interface:

- Full Coverage and always available connectivity ensured by signaling base stations only
- Data access capacity provided by data base stations on demand

# From base station power profile to network profile

## Base station

## Whole network

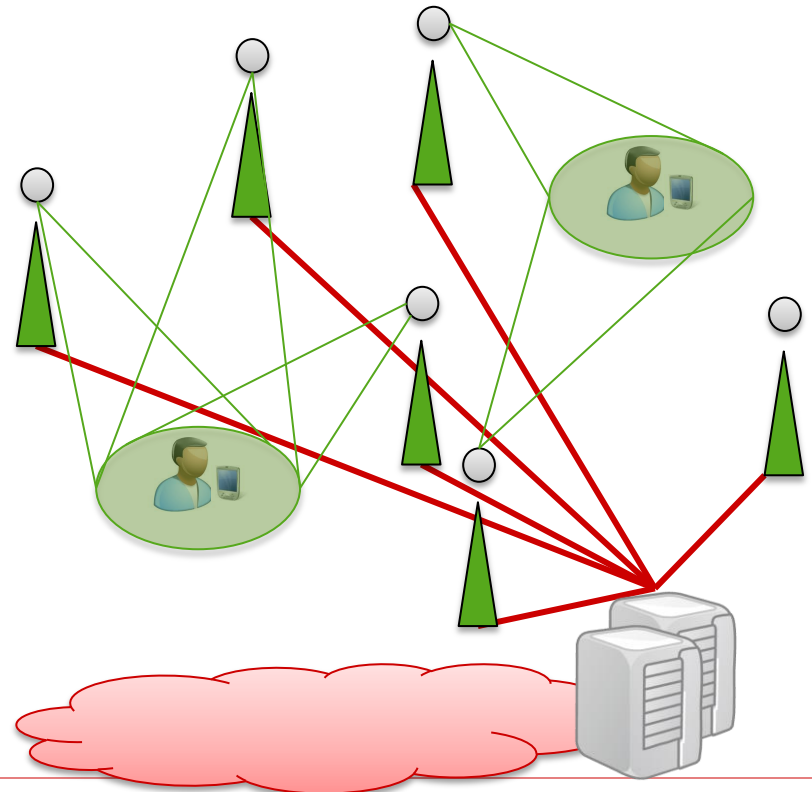

# Individual cells

## □ Long term scenario

1) From femto cells  
to individual “**atto cells**”

2) Individual **virtual cells**  
with centralized  
processing and distributed  
antennas

# Technical challenges (1)

- **Quantitative analysis of the fundamental advantages of the BCG architecture,** primarily in terms of energy consumption.
- We are working on:
  - Analytical models based on: stochastic processes, mathematical programming, integral and stochastic geometry
  - Simulation: Monte Carlo, discrete event simulation at system level
- Estimated gains vary based on traffic statistics (over time and space), coverage layout, etc.

# BCG<sup>2</sup> Energy efficiency gain

**2010**

Reference scenario:  
Macro BSs only (SCENARIO 1)  
Always-on  
Low traffic level

**2015**

Mixed scenario with BCG  
60% micro, 40 macro BSs (SCENARIO 2)  
BCG energy management  
Medium traffic level

**2020**

Micro/pico cellular scenario  
10% macro, 60% micro, 30% pico BSs (SCENARIO 3)  
BCG energy management  
High traffic level

**Long term scenario**

Atto cellular scenario  
100% atto BSs  
BCG energy management  
Any traffic level

**2010**

*Urban: 3887*  
*Dense U: 1296*  
*[10<sup>-3</sup> J/kbit]*

**2015**

*Urban: 30-50X*  
*Dense U: 15-25X*

**2020**

*Urban: 70-90X*  
*Dense U: 30-50X*

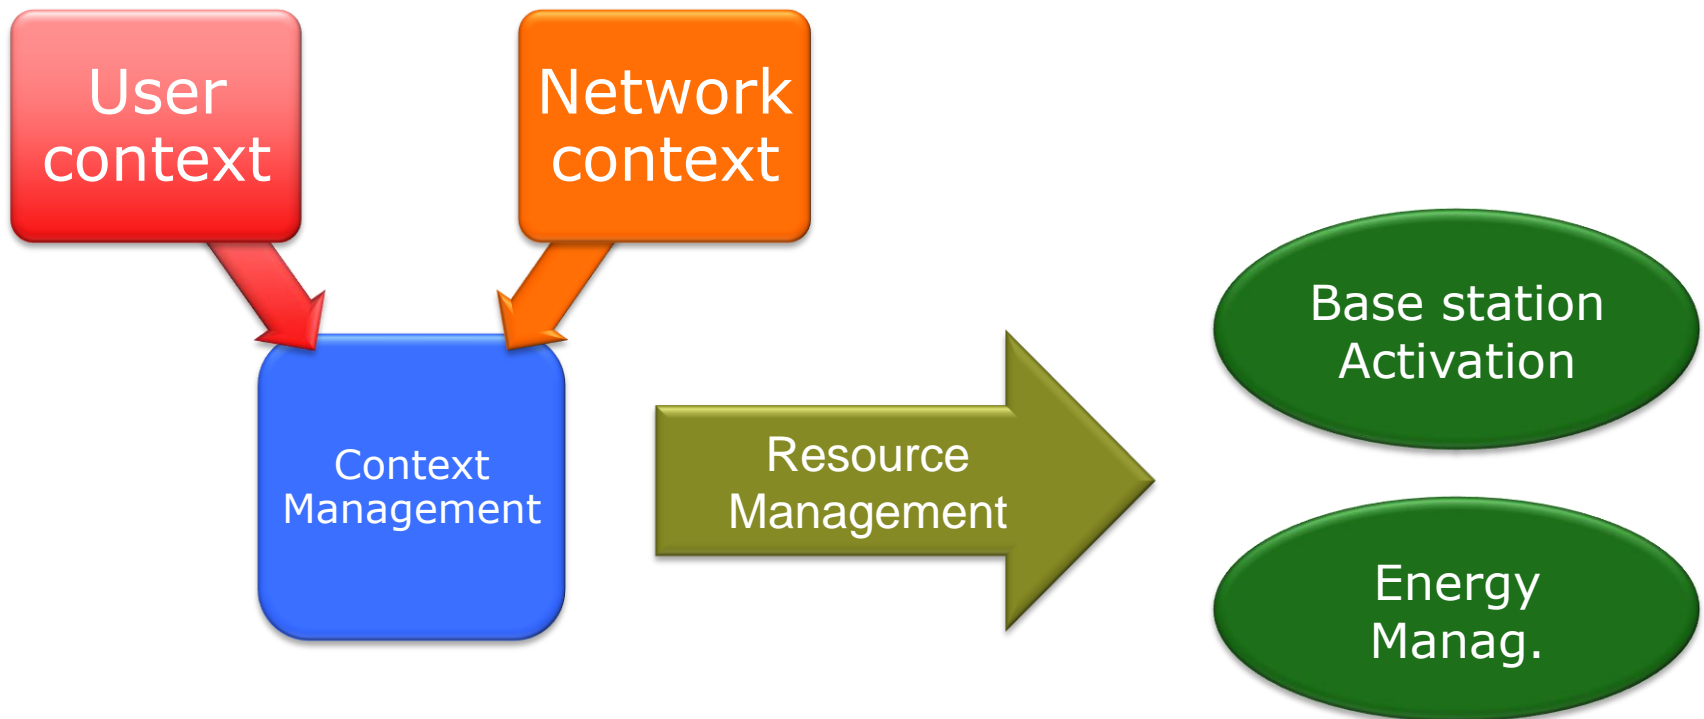

**20xx**

*Urban: >1000X*  
*Dense U: >500X*

# Technical challenges (2)

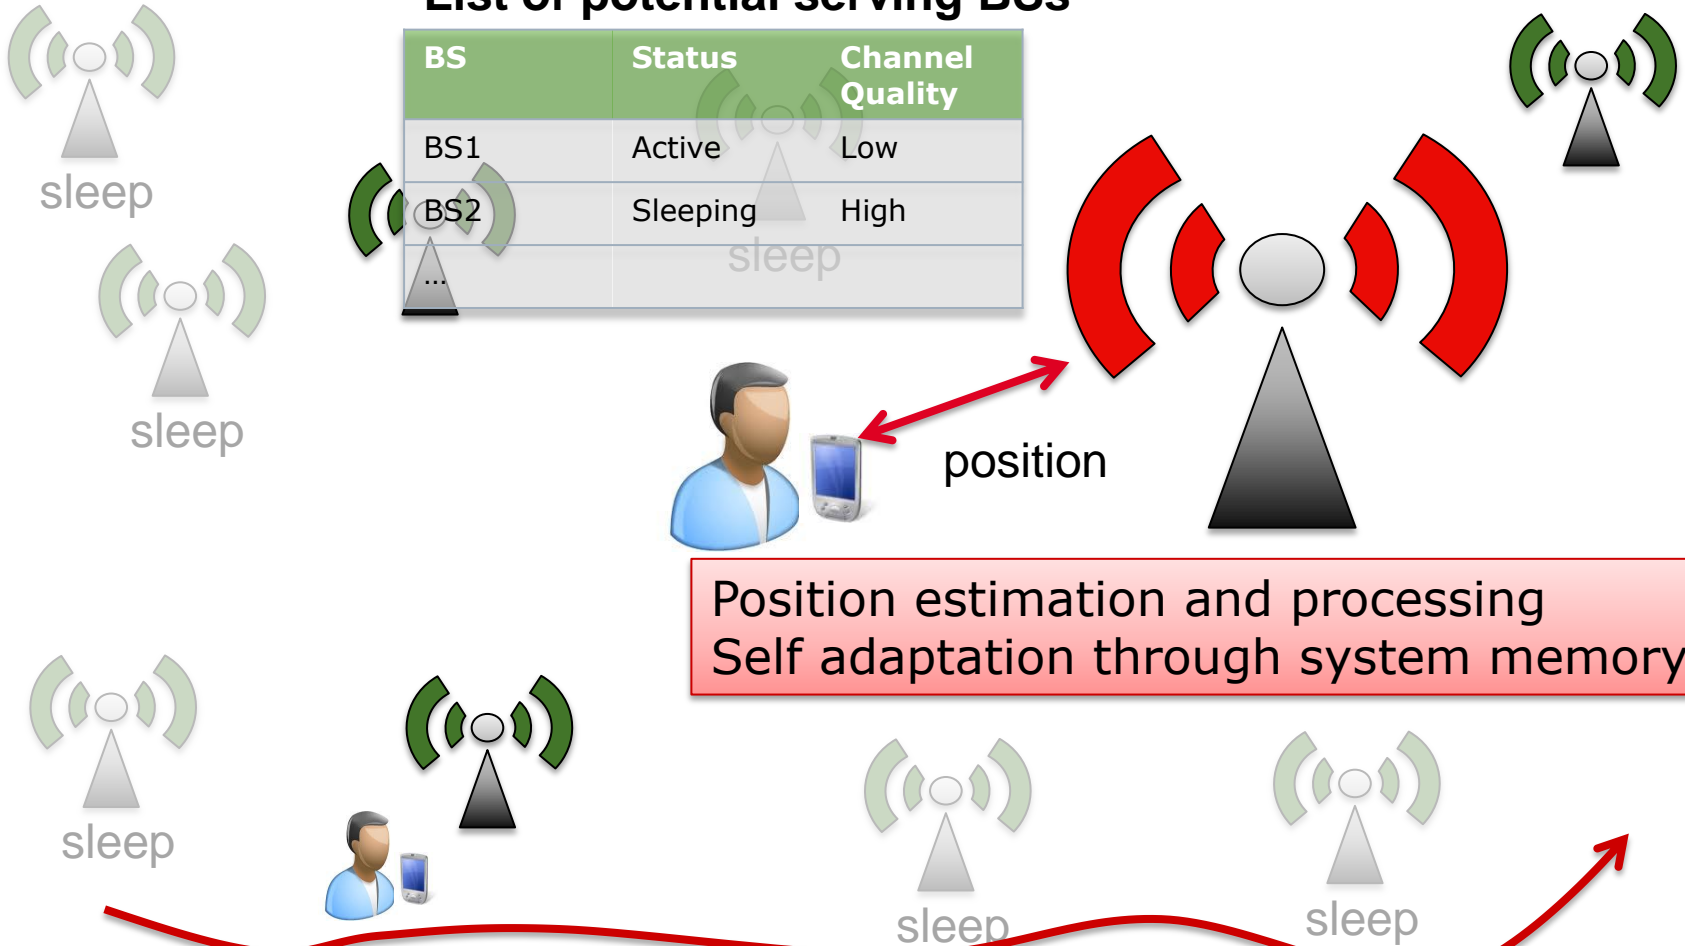

- **“Context” information** for intelligent resource selection algorithms that assign requests to access points and activates radio resources.

# Context Awareness: Position & Mobility

List of potential serving BSs

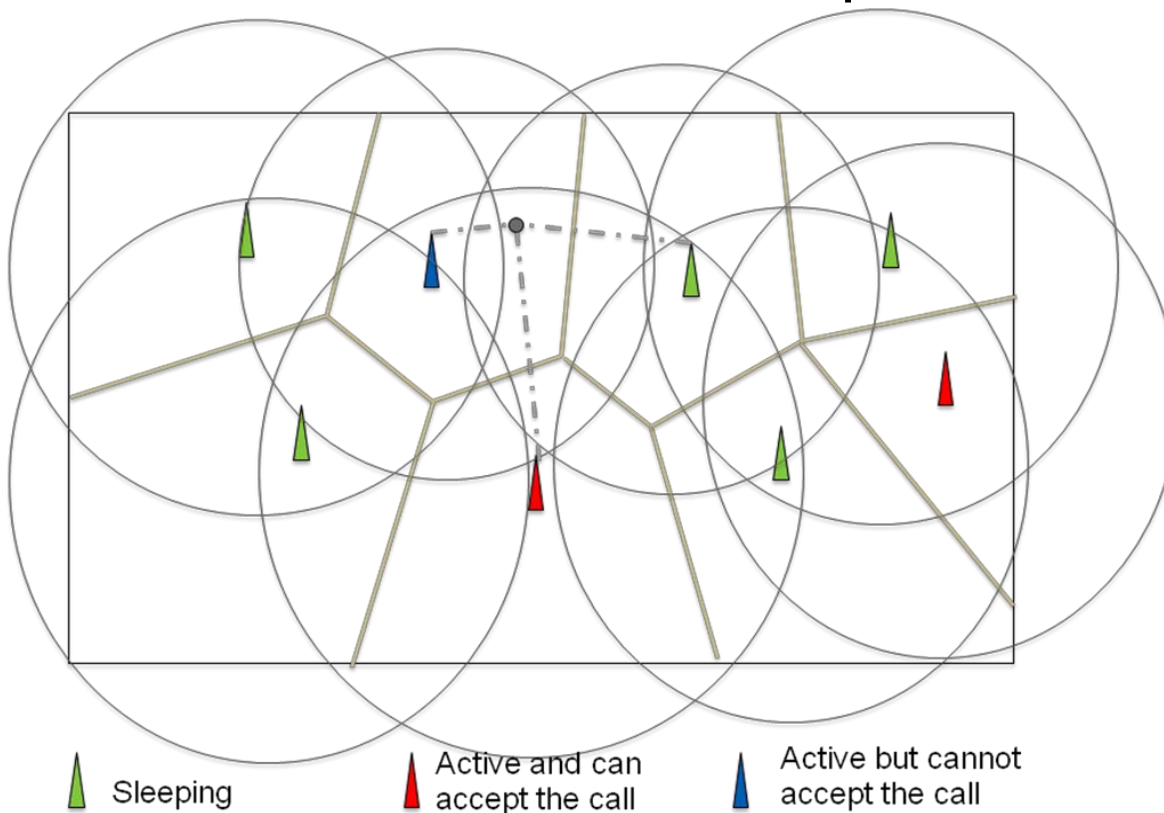

BS	Status	Channel Quality
BS1	Active	Low
BS2	Sleeping	High
...		

Mobility pattern prediction

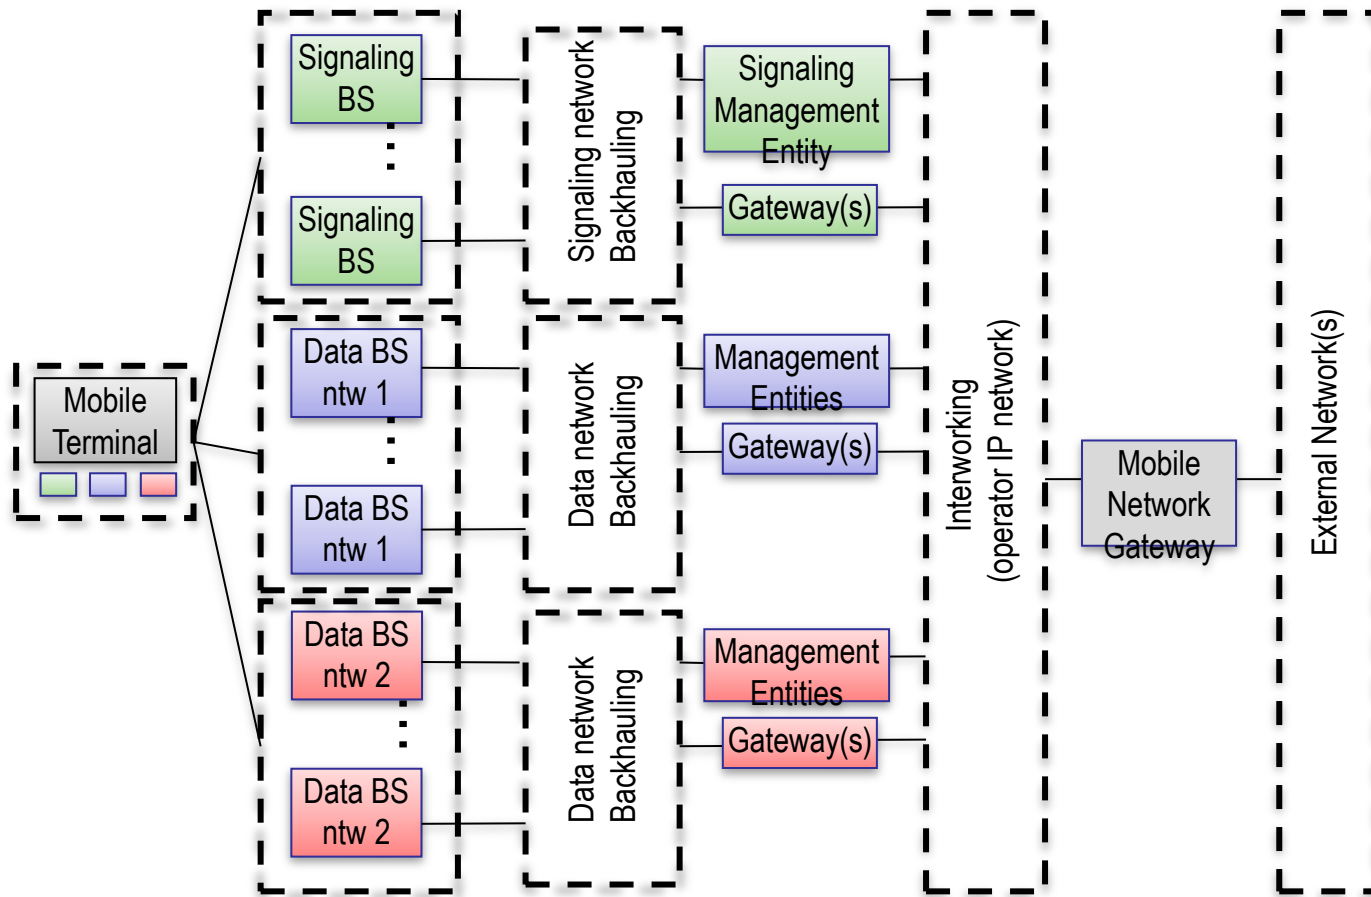

# Technical challenges (3)

- **Agile resource selection algorithms** to select the most suitable access point and radio resources to serve traffic requests.

# Technical challenges (4)

## □ Signaling network architecture and functionalities

# Technical challenges (5)

- **Interaction mechanisms between the signaling network and the (heterogeneous) data networks** for the resource activation, call control, mobility management, power management
  - Energy efficiency is not the only advantage of the new architecture
  - Integrated management of heterogeneous wireless access technologies, possible new business models and interaction between operators
  - Critical issues related to the signaling overhead due to smart phone state transitions

# Conclusion

---

- ❑ BCG<sup>2</sup> is a revolutionary mobile system architecture based on the separation of data access (capacity) and signaling (coverage)
- ❑ It allows unprecedented reduction of energy consumption
- ❑ Moreover it makes the management of mobile system more agile and cost efficient

# Thanks!
